SUMMARY

Full-stack developer who builds and ships complete products end-to-end: database design, REST APIs, web interfaces, automated tests, CI/CD and cloud deployment. I designed, built and still run **KOGA**, the ERP / POS system my store runs on every day across **2 branches with 10+ staff**. That work took 1,100+ commits, 340+ merged pull requests and 105 automated test suites. I understand the business side because I use my own software in my own store, and I'm looking for a full-stack or backend developer role where I can take ownership of real products.

EXPERIENCE

Founder & Full-Stack Developer

KOGA Retail Management System — Abdulla Barza Store

01/2026 – Present Qaladze, Iraq

ERP, inventory and point-of-sale platform built for my own wholesale & retail store; in daily production use.

- Designed and built the whole system alone: an **ASP.NET Core 8** REST API (47 controllers, ~31k lines of C#, 290+ EF Core migrations on PostgreSQL) and a **Next.js 16 / React 19** web app (~77k lines of TypeScript) with a fully right-to-left Sorani Kurdish interface.
- Runs the store's real operations: **2 branches, 10+ daily users** across admin, warehouse, cashier and field-sales roles, each with its own permissions.
- Built an **offline-first POS**. Sales are saved in IndexedDB and replayed through a sync queue with **idempotency keys**, so a lost internet connection never loses or duplicates a sale. It works with hardware barcode scanners, label printing and receipt printing.
- Modelled real retail rules: multi-branch stock and transfers, unit hierarchy (carton › pack › piece), weighted (kg) products, wholesale/retail/special price tiers, purchase orders, supplier invoices and claims, expiry tracking, stock counts and daily cash close.
- Built a **field-sales (delegate) module** with customer visits, route and order maps (Leaflet), customer statements and debt reminders, commission and pay calculation, and Telegram-bot notifications for new orders.
- Every change is recorded: EF Core interceptors write a full **audit log** and an append-only **stock ledger**, and a background worker (System.Threading.Channels) processes stock updates asynchronously.
- Business analytics include revenue vs. profit, margin-squeeze alerts, customer insights, sales by category and automatic **reorder suggestions**, with Excel and PDF export.
- Wrote **53 API integration test suites** that run against a real PostgreSQL database (no mocks) and **52 Playwright end-to-end suites**. GitHub Actions runs them on every pull request, and merges deploy automatically to Cloudflare Pages (frontend) and Render (API, Docker).

KEY ACHIEVEMENTS

Software a real business runs on
KOGA runs daily sales, stock and accounting for 2 branches and 10+ staff.

105 automated test suites
53 API integration + 52 Playwright E2E suites, run on every pull request in CI.

1,100+ commits, 340+ merged PRs
On KOGA in under a year, with a professional pull-request & CI workflow.

Works without internet
Offline-first POS with sync queue and idempotent API. No lost or double sales.

~110k lines of production code
Database, API, UI, tests and deployment all built and maintained solo.

SKILLS

LANGUAGES

TESTING & DEVOPS
Playwright Integration testing GitHub Actions Docker Git

CLOUD
Render Vercel Cloudflare Pages Neon Netlify

EXPERIENCE (CONTINUED)

Freelance Web Developer

Self-employed — local businesses in Qaladze

2025 – Present Qaladze, Iraq

- **Fast Pizza Qaladze, digital menu → QR table-ordering system.** Started as a menu website on Netlify, then grew into an ordering system: customers scan the QR code on their table, browse the menu and order with no account or app, and orders appear instantly on a kitchen screen with the table number. Built on Supabase (PostgreSQL, Row-Level Security, Realtime), with an admin panel for prices, tables and printable QR codes. Installable as a PWA. Delivered in under a week.
- **Ashty Market, supplier & transaction tracker.** An ASP.NET Core API (Identity + JWT, PostgreSQL) and a Next.js PWA for recording supplier purchases and payments, with phone-photo upload and automatic HEIC→JPEG conversion.
- **Currency exchange rate board.** A mobile-friendly price board where the exchange office edits currency, gold and silver rates and exports a ready-made image for social media in one tap (creative-fenglisu-045c0d.netlify.app).

PROJECTS

Xanchy: Online Ticket Booking Platform

University research project — Salahaddin University

11/2025 – 04/2026

A full ticketing platform for events, concerts and sports in Kurdistan, with separate experiences for customers, organizers and admins.

- Built an interactive **SVG seat map** (zoom & pan) with timed seat holds and a live countdown. A .NET background service releases expired holds automatically, so a seat can never be sold twice.
- **Organizer dashboard** with sales and finance reports and Excel export, plus venue, event, ticket-tier and **promo-code** management.
- JWT authentication, favourites, advertisement slides, **Web Push notifications** and scheduled event reminders / status updates through hosted services.
- ASP.NET Core 8 API (14 controllers, EF Core, PostgreSQL, ImageKit uploads, Docker) and a Next.js 16 / React 19 frontend with dark mode and GSAP animations, deployed on Vercel and Render.

Dev News: Community News Site

Personal project

2025

- A news / blog site for developers with registration, login and user profiles, built with PHP and SQLite.

REST API practice projects

Personal projects

2025

- Library (books, members, borrowing) and shop REST APIs in ASP.NET Core, EF Core and PostgreSQL with Swagger. These were the foundation for the larger systems above.

EDUCATION

B.Sc. Computer Science & Information Technology

Salahaddin University – Erbil

Graduated 2026

Research project: **Xanchy**, an online ticket booking platform.

STRENGTHS

Self-driven builder
Turned an idea into a system a business depends on, with no team or manager.

Business understanding
I know retail, stock and sales from running a store, not only from code.

Fast learner
Picked up Next.js 16, offline-first design, E2E testing and CI/CD on real projects.

HOW I WORK

- **Own it end-to-end.** I take a feature from the business problem through the database, API, UI and tests to production.
- **Test what matters.** My integration and E2E tests hit a real database and a real browser, not mocks.
- **Ship small and often.** Every change goes through a pull request and CI, and deploys automatically.
- **Build for real users.** I design for cashiers, warehouse staff and field reps working on phones, often with a weak connection.

CURRENTLY LEARNING

AI / LLM integration Python
